

WEED CONTROL

WEED CONTROL

Early action is key to controlling weeds in your lawn and garden. As each season brings new growth, it's important to take proactive steps to prevent weeds from taking over throughout the year. Here's how you can stay ahead.

1 IDENTIFY COMMON WEEDS

In Colorado, keep an eye out for common weeds like dandelions, crabgrass, bindweed and ragweed. These weeds can appear throughout the year. Identifying them early in any season allows you to take targeted action.

2 APPLY PRE-EMERGENT HERBICIDES

Applying pre-emergent herbicides now helps prevent weed seeds from germinating. This creates a protective barrier in your soil, stopping weeds before they sprout.

3 MULCH GARDEN BEDS

Adding a 2-3 inch layer of organic mulch blocks sunlight, preventing weeds from growing while helping to retain moisture and improve soil health.

4 HAND WEEDING

Hand pulling weeds is most effective when the soil is moist and the weeds are still small. Be sure to remove the roots to prevent regrowth.

5 USE POST-EMERGENT HERBICIDES

If weeds have already sprouted, post-emergent herbicides can help target and eliminate them without harming your lawn.

6 NATURAL WEED CONTROL

For a chemical free approach, use boiling water, vinegar or corn gluten meal to naturally eliminate weeds in garden areas or walkways.
